The height of a binary tree is the number of edges between the tree's root and its furthest leaf. For example, the following binary tree is of height **2**:

### Function Description

Complete the getHeight or height function in the editor. It must return the height of a binary tree as an integer.

getHeight or height has the following parameter(s):

- root: a reference to the root of a binary tree.

**Note** -The Height of binary tree with single node is taken as zero.

### Input Format

The first line contains an integer **n**, the number of nodes in the tree.

Next line contains **n** space separated integer where **i**th integer denotes node[i].data.

**Note:** Node values are inserted into a binary search tree before a reference to the tree's root node is passed to your function. In a binary search tree, all nodes on the left branch of a node are less than the node value. All values on the right branch are greater than the node value.

### Constraints

$$1 \leq \text{node.data}[i] \leq 20$$

$$1 \leq n \leq 20$$

### Output Format

Your function should return a single integer denoting the height of the binary tree.

### Sample Input

### Sample Output

3

### Explanation

The longest root-to-leaf path is shown below:

There are **4** nodes in this path that are connected by **3** edges, meaning our binary tree's **height = 3**.

Python 3

```
1 class Node: ...
36
37 # Enter your code here. Read input from STDIN. Print output to STDOUT
38 '''
39 class Node:
40     def __init__(self,info):
41         self.info = info
42         self.left = None
43         self.right = None
44
45
46         // this is a node of the tree , which contains info as data, left , right
47     '''
```

```
48 def height(root):
49     if root is None:
50         return -1
51     return max(height(root.left), height(root.right)) + 1
52 ...
```
